Summary

Back-end and full stack developer with **5 years in financial systems, ERP, nationwide e-commerce, and applications for industry and mining**. I work from requirements to production: REST APIs in PHP/Laravel and Node.js, integrations between ERP, Salesforce, and e-commerce, React, Vue, and TypeScript interfaces, legacy modernization, and production support. In my public projects I apply **concurrency control, idempotency, a transactional outbox with RabbitMQ, PostgreSQL Row Level Security, and Go with context.Context**, always with tests that reproduce a failure before the fix and decisions recorded in ADRs.

Technical skills

Back end: PHP 8, Laravel (Eloquent, queues, Sanctum), Node.js (Fastify), Go (goroutines, context.Context, WebAssembly), Rust, C#/.NET, ASP.NET, Python, REST APIs, OpenAPI/Swagger, Insomnia and Postman
Reliability: Transactions and SELECT … FOR UPDATE, Redis distributed locks, idempotency (Idempotency-Key), transactional outbox and inbox, RabbitMQ (publisher confirms, DLQ), compensation for partial failures, timeouts, cancellation and partial responses, multi-tenant isolation
Data: MySQL, SQL Server, PostgreSQL (Row Level Security), Oracle and PL/SQL, Redis (cache, locks, queues), SQLite, data modeling and query optimization
Salesforce: Apex, Triggers, Lightning Web Components, Aura, Visualforce, Flows and Process Builder, SOQL and SOSL, Sales Cloud, MuleSoft
Front end & mobile: TypeScript, JavaScript, React, Vue 3, Angular, React Native (Expo), HTML, CSS, Tailwind, Material-UI, Chart.js, Vite, WordPress, Oracle APEX
Testing & quality: PHPUnit, Pest (incl. architecture tests), Jest, Vitest, node:test, go test -race, concurrency tests on MySQL and RLS tests on PostgreSQL, Larastan/PHPStan level 8, Pint, ESLint
DevOps & cloud: Docker and Docker Compose, CI/CD (GitHub Actions, GitLab CI), Git, Linux, AWS, Azure, Supabase (Auth, Realtime, Edge Functions), k6, capacity testing with cgroups
Practices: SOLID, Clean Code, layered and ports-and-adapters architecture, state machines, ADRs, Agile and Scrum, Figma, AI-assisted development (Claude) validated through tests and diff review

Professional experience

Grupo Mysa — Full Stack Developer

Jun 2024 – Present · ERP · Nationwide e-commerce · Integrations

- Build, maintain, and evolve **large enterprise systems (ERP, nationwide e-commerce, and branch management)**, focusing on legacy modernization, integrations, and production support.
- Implement business rules, **REST APIs, and back-end services in PHP/Laravel, JavaScript, and TypeScript**, integrating systems and evolving existing features.
- Build and integrate **Salesforce solutions with Apex, LWC, Triggers, Flows, SOQL, and SOSL**, connecting sales processes, ERP, and e-commerce, on **AWS**.
- Analyze requirements, design technical solutions, investigate failures, debug, and refactor with performance, security, maintainability, and business continuity in mind.
- Work across the **full cycle** with cross-functional teams: understanding the business, implementation, Git versioning, validation, deployment, and production monitoring.

Easy Process EHS-S / Triadd — Software Engineer

Oct 2024 – May 2025 · Industry · Mining · Agribusiness

- Built and evolved enterprise systems for operational management, auditing, process control, and data integrity for clients such as **Albras, Raízen, Tereos, FS Bioenergia, Keune, and Vale**.
- Built **Oracle APEX, SQL, and PL/SQL** applications: data modeling and queries, procedures, triggers, validations, and business rules for complex operational processes.
- Created forms, management reports, data extracts, and operational documents, **integrating with other enterprise systems through REST APIs**.
- Maintained and troubleshot applications in **critical operational environments**, preserving data consistency, security, and process continuity.

ZR System — PHP Developer

Jun 2024 – Sep 2024 · Legacy · MVC · Automation

- Built and evolved a **legacy PHP system with an MVC architecture** for operational process automation, connecting presentation, business logic, and persistence.
- Maintained the **MySQL** operations (queries, data handling, and automated-process features) and reorganized code while keeping existing workflows intact.
- Used Git for version control and agile practices to plan and track deliveries.

Sicoob Central Cecremge — Full Stack Developer

Jun 2021 – Jun 2024 · Financial systems · Credit unions

- Built, maintained, and modernized **enterprise and financial systems used by credit unions**, delivering full stack solutions, integrations, and production support.
- Built **back-end services and REST APIs in PHP/Laravel**, with experience in C#/.NET, Node.js, and Python, and interfaces in **React, TypeScript, and JavaScript**.
- Worked with **Microsoft Azure, SQL Server, and MySQL**, and modernized legacy PHP and JavaScript systems through refactoring, bug fixes, and hotfixes.
- Applied **SOLID**, modular code, and testing with **PHPUnit and Jest**; took part in **GitLab CI/CD**, code review, Docker, Linux, deployment, and incident investigation.
- Worked in agile teams (Scrum, Trello, Planner, GitLab Issue Boards) from technical planning to delivery.

Construtora Você — Systems Analyst

Mar 2018 – Dec 2020 · Salesforce CRM · Commercial processes

- Helped **implement and consolidate Salesforce** as the platform for sales processes, standardizing workflows and organizing information.
- Analyzed requirements and process problems, supported feature configuration, and validated solutions with users.
- Provided functional support, documented processes, and trained staff on enterprise systems.
- Analyzed and validated **financial information for mortgage credit processes** on platforms integrated with operations.

Internship at Caixa Econômica Federal (Nov 2016 – Nov 2017).

Projects

TripFlow — A corporate travel API built around three production problems: concurrent approvals competing for the same budget, booking retries, and failures between the database and the broker. (github.com/acamilateixeira/tripflow)
PHP 8.3 · Laravel 12 · MySQL · Redis · RabbitMQ · Docker · Pest · Larastan

- **SELECT ... FOR UPDATE** on the cost center keeps two approvals from spending the same balance; a test with two MySQL connections proves the approval waits for the lock.
- **Idempotency-Key** replays the saved response for retries; during booking, a **Redis lock** serializes booking and cancellation, and bookings already confirmed are **compensated** at the supplier when another part fails.
- A **transactional outbox** publishes to RabbitMQ after commit with publisher confirms; the consumer deduplicates redeliveries through an inbox. Company scoping and tenant-isolation tests.

GEMP — A fictional credit comparison tool that queries three providers in parallel and compares total cost, showing what the UI can still deliver when a provider is slow or down. (github.com/acamilateixeira/GEMP)
Go · net/http · WebAssembly · React · TypeScript · Vite · GitHub Actions

- Each provider runs in a **goroutine with context.Context** and its own 250 ms deadline; partial results when one fails, 503 with no offers, and a panicking provider becomes an isolated failure.
- The public demo runs **the same Go code compiled to WebAssembly** in the browser, verified in CI against the API's scenarios.

Bora — An app requested by the municipality of Conceição do Mato Dentro, Brazil, for a temporary operation: contracted drivers' rides, requesters, destinations, contacts, and eligibility per department. (github.com/acamilateixeira/Bora)
React Native · Expo · TypeScript · Supabase Auth · PostgreSQL · Realtime · Edge Functions

- Every access rule lives in the database: **Row Level Security** per department and security definer functions, covered by a SQL suite that runs in CI against Postgres 16.
- Fixed the ride-assignment policy with tests that reproduced the problem and a **partial unique index** that prevents two simultaneous accepts of the same ride.

Other projects: Emppo Finance (Node.js, Fastify, SQLite, amounts in cents), Sorteador (Angular, auditable draws with a SHA-256 commitment), MeterTrail (Rust, usage metering without double counting after failures), and Livit Live Controller (Python and Node.js for TikTok LIVE). Details at acamilateixeira.github.io/camilat.

Education

- Technologist degree in Systems Analysis and Development — Unibta (2021–2023)
- Technologist degree in Business Process Management — Estácio (2024–2025)
- Computer Science — degree in progress
- Additional: Modern Software Engineering (UFMG) · Salesforce Admin / App Builder track
